About copying projects

Copying an existing project

You can use an existing project as a template by copying it.

About copying projects [↗](#)

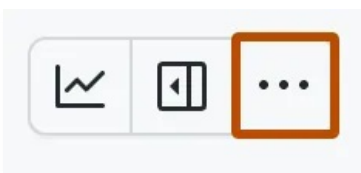

You can copy an existing project and use it as a template to save time configuring your views and custom fields.

When you copy a project, the new project will contain the same views, custom fields, and draft issues. The new project will not contain the original project's items, workflows, insights, collaborators, or team and repository links.

You can also set projects in your organization as templates that other organization members can then use as the base for the projects they create. For more information, see "[Managing project templates in your organization](#)."

Copying an existing project [↗](#)

- 1 Navigate to the project you want to copy.
- 2 In the top-right, click ... to open the menu.

- 3 In the menu, click  **Make a copy**.
- 4 Optionally, if you want all draft issues to be copied with the project, in the "Make a copy" dialog, select **Draft issues will be copied if selected**.

Make a copy

You can make a copy of this project and use it as a starting point for another project.

✓ Views and custom fields will be copied.

— Issues, pull requests, workflows, and insights will not be copied.

☐ Draft issues will be copied if selected
