

Reviewing your deploy keys

You should review deploy keys to ensure that there aren't any unauthorized (or possibly compromised) keys. You can also approve existing deploy keys that are valid.

- 1 On your GitHub Enterprise Server instance, navigate to the main page of the repository.
- 2 Under your repository name, click  **Settings**. If you cannot see the "Settings" tab, select the ... dropdown menu, then click **Settings**.

- 3 In the "Security" section of the sidebar, click  **Deploy keys**.
- 4 On the "Deploy keys" page, take note of the deploy keys associated with your account. For those that you don't recognize, or that are out of date, click **Delete**. If there are valid deploy keys you'd like to keep, click **Approve**.

For more information, see "[Managing deploy keys](#)."
