

database unbundle

In this article

Synopsis

Description

Options

Extracts a CodeQL database archive.

GitHub CodeQL is licensed on a per-user basis upon installation. You can use CodeQL only for certain tasks under the license restrictions. For more information, see "[About the CodeQL CLI](#)." If you have a GitHub Advanced Security license, you can use CodeQL for automated analysis, continuous integration, and continuous delivery. For more information, see "[About GitHub Advanced Security](#)."

This content describes the most recent release of the CodeQL CLI. For more information about this release, see <https://github.com/github/codeql-cli-binaries/releases>.

To see details of the options available for this command in an earlier release, run the command with the `--help` option in your terminal.

Synopsis

Shell

```
codeql database unbundle <options>... -- <archive>
```

Description

Extracts a CodeQL database archive.

This command extracts a CodeQL database archive created by [codeql database bundle](#). It is similar to using unzip to extract the database, but performs better in certain scenarios (for instance, unzip is very slow on Windows) and supports additional options such as setting the name of the database extracted.

Options

Primary Options

`<archive>` 

[Mandatory] Path to the CodeQL database archive to unzip.

--name=<name> 

The name to give the CodeQL database created. If not provided, this will match whatever name the database has in the archive.

--target=<target> 

The directory to unzip the CodeQL database in. If not provided, this will default to the current working directory.

Common options

-h, --help 

Show this help text.

-J=<opt> 

[Advanced] Give option to the JVM running the command.

(Beware that options containing spaces will not be handled correctly.)

-v, --verbose 

Incrementally increase the number of progress messages printed.

-q, --quiet 

Incrementally decrease the number of progress messages printed.

--verbosity=<level> 

[Advanced] Explicitly set the verbosity level to one of errors, warnings, progress, progress+, progress++, progress+++. Overrides **-v** and **-q**.

--logdir=<dir> 

[Advanced] Write detailed logs to one or more files in the given directory, with generated names that include timestamps and the name of the running subcommand.

(To write a log file with a name you have full control over, instead give **--log-to-stderr** and redirect stderr as desired.)
