

This version of GitHub Enterprise was discontinued on 2023-03-15. No patch releases will be made, even for critical security issues. For better performance, improved security, and new features, [upgrade to the latest version of GitHub Enterprise](#). For help with the upgrade, [contact GitHub Enterprise support](#).

Setting up external monitoring

In this article

About SNMP

About collectd

You can monitor basic system resources on your GitHub Enterprise Server appliance using either the SNMP or collectd statistics collection protocols.

About SNMP [↗](#)

Simple Network Management Protocol (SNMP) is a widely supported method of monitoring network devices and servers. SNMP is disabled by default but can be configured through the GitHub Enterprise monitor dashboard. UDP port 161 must be open and reachable from your network management station. For more information, see "[Monitoring using SNMP](#)."

About collectd [↗](#)

collectd is an open source statistics collection and reporting daemon with built-in support for writing to RRD files. Statistics on CPU utilization, memory and disk consumption, network interface traffic and errors, and system load can be forwarded to an external collectd server where graphs, analysis, and alerting may be configured using a wide range of available tools and plugins. To configure `collectd` forwarding, see "[Configuring collectd](#)".

Additionally, the monitoring tools built into underlying virtualization platforms may also be used for basic monitoring and alerting of system resources. For more information, see [Amazon CloudWatch](#) and [VMware vSphere Monitoring](#) documentation.
