

Error: Permission to user/repo denied to user/other-repo

This error means the key you are pushing with is attached to another repository as a deploy key, and does not have access to the repository you are trying to push to.

To fix this, remove the deploy key from the repository, and [add the key to your personal account](#) instead.

If the key you are using is intended to be a deploy key, check out [our guide on deploy keys](#) for more details.
