

Identifying vulnerabilities in your project's dependencies with Dependabot alerts

Dependabot generates Dependabot alerts when known vulnerabilities are detected in dependencies that your project uses.

About Dependabot alerts

GitHub sends Dependabot alerts when we detect that your repository uses a vulnerable dependency or malware.

Configuring Dependabot alerts

Enable Dependabot alerts to be generated when a new vulnerable dependency or malware is found in one of your repositories.

Viewing and updating Dependabot alerts

If GitHub discovers insecure dependencies in your project, you can view details on the Dependabot alerts tab of your repository. Then, you can update your project to resolve or dismiss the alert.

Configuring notifications for Dependabot alerts

Optimize how you receive notifications about Dependabot alerts.
