

**This version of GitHub Enterprise was discontinued on 2023-03-15.** No patch releases will be made, even for critical security issues. For better performance, improved security, and new features, [upgrade to the latest version of GitHub Enterprise](#). For help with the upgrade, [contact GitHub Enterprise support](#).

# Enabling the dependency graph for your enterprise

## In this article

About the dependency graph

Enabling the dependency graph via the Management Console

Enabling the dependency graph via the administrative shell

---

You can allow users to identify their projects' dependencies by enabling the dependency graph.

## Who can use this feature

Site administrators can enable the dependency graph.

## About the dependency graph

The dependency graph is a summary of the manifest and lock files stored in a repository. For each repository, it shows dependencies, that is, the ecosystems and packages it depends on.

GitHub Enterprise Server does not calculate information about dependents, the repositories and packages that depend on a repository. For more information, see "[About the dependency graph](#)".

After you enable the dependency graph, users will have access to the dependency review feature. Dependency review helps you understand dependency changes and the security impact of these changes at every pull request. For more information, see "[About dependency review](#)".

After you enable the dependency graph for your enterprise, you can enable Dependabot to detect insecure dependencies in your repository and automatically fix the vulnerabilities. For more information, see "[Enabling Dependabot for your enterprise](#)".

You can enable the dependency graph via the Management Console or the administrative shell. We recommend using the Management Console unless your GitHub Enterprise Server instance uses clustering.

## Enabling the dependency graph via the Management Console

If your GitHub Enterprise Server instance uses clustering, you cannot enable the dependency graph with the Management Console and must use the administrative shell instead. For more information, see "[Enabling the dependency graph via the](#)

[administrative shell](#)."

- 1 Sign in to your GitHub Enterprise Server instance at `http(s)://HOSTNAME/login`.
- 2 From an administrative account on GitHub Enterprise Server, in the upper-right corner of any page, click .
- 3 If you're not already on the "Site admin" page, in the upper-left corner, click **Site admin**.
- 4 In the " Site admin" sidebar, click **Management Console**.
- 5 In the "Settings" sidebar, click **Security**.
- 6 Under "Security," select **Dependency graph**.
- 7 Under the "Settings" sidebar, click **Save settings**.

**Note:** Saving settings in the Management Console restarts system services, which could result in user-visible downtime.

- 8 Wait for the configuration run to complete.
- 9 Click **Visit your instance**.

## Enabling the dependency graph via the administrative shell

- 1 Sign in to your GitHub Enterprise Server instance at `http(s)://HOSTNAME/login`.
- 2 In the administrative shell, enable the dependency graph on your GitHub Enterprise Server instance:

```
ghe-config app.dependency-graph.enabled true
```

**Note:** For more information about enabling access to the administrative shell via SSH, see "[Accessing the administrative shell \(SSH\)](#)."

- 3 Apply the configuration.

```
$ ghe-config-apply
```

- 4 Return to GitHub Enterprise Server.
