

Adding your project to a repository

You can add your project to a repository to make it accessible from that repository.

You can list relevant projects in a repository. You can only list projects that are owned by the same user or organization that owns the repository.

In order for repository members to see a project listed in a repository, they must have visibility for the project. For more information, see "[Managing visibility of your projects](#)" and "[Managing access to your projects](#)."

- 1 On GitHub, navigate to the main page of your repository.
- 2 Click  **Projects**.

- 3 Click **Link project**.
- 4 In the search bar that appears, search for projects that are owned by the same user or organization that owns the repository.
- 5 Click on a project to list it in your repository.
