

Cloning a repository

In this article

- About cloning a repository
- Cloning a repository
- Cloning an empty repository
- Troubleshooting cloning errors

When you create a repository on your GitHub Enterprise Server instance, it exists as a remote repository. You can clone your repository to create a local copy on your computer and sync between the two locations.

Mac Windows Linux

GitHub CLI Desktop Web browser

About cloning a repository

You can clone a repository from your GitHub Enterprise Server instance to your local computer to make it easier to fix merge conflicts, add or remove files, and push larger commits. When you clone a repository, you copy the repository from your GitHub Enterprise Server instance to your local machine.

You can clone a repository from your GitHub Enterprise Server instance to your local computer to make it easier to fix merge conflicts, add or remove files, and push larger commits. When you clone a repository, you copy the repository from your GitHub Enterprise Server instance to your local machine.

You can clone a repository from your GitHub Enterprise Server instance to your local computer to make it easier to fix merge conflicts, add or remove files, and push larger commits. When you clone a repository, you copy the repository from your GitHub Enterprise Server instance to your local machine.

Cloning a repository pulls down a full copy of all the repository data that your GitHub Enterprise Server instance has at that point in time, including all versions of every file and folder for the project. You can push your changes to the remote repository on your GitHub Enterprise Server instance, or pull other people's changes from your GitHub Enterprise Server instance. For more information, see "[Using Git](#)".

You can clone your existing repository or clone another person's existing repository to contribute to a project.

Cloning a repository

- 1 On your GitHub Enterprise Server instance, navigate to the main page of the repository.

- 2 Above the list of files, click <> **Code**.

- 3 Copy the URL for the repository.

- To clone the repository using HTTPS, under "HTTPS", click .
- To clone the repository using an SSH key, including a certificate issued by your organization's SSH certificate authority, click **SSH**, then click .
- To clone a repository using GitHub CLI, click **GitHub CLI**, then click .

- 4 Open TerminalTerminalGit Bash.

- 5 Change the current working directory to the location where you want the cloned directory.

- 6 Type `git clone`, and then paste the URL you copied earlier.

```
git clone https://HOSTNAME/YOUR-USERNAME/YOUR-REPOSITORY
```

- 7 Press **Enter** to create your local clone.

```
$ git clone https://HOSTNAME/YOUR-USERNAME/YOUR-REPOSITORY
> Cloning into `Spoon-Knife`...
> remote: Counting objects: 10, done.
> remote: Compressing objects: 100% (8/8), done.
> remove: Total 10 (delta 1), reused 10 (delta 1)
> Unpacking objects: 100% (10/10), done.
```

To learn more about GitHub CLI, see "[About GitHub CLI](#)."

To clone a repository locally, use the `repo clone` subcommand. Replace the `repository` parameter with the repository name. For example, `octo-org/octo-repo`, `monalisa/octo-repo`, or `octo-repo`. If the `OWNER/` portion of the `OWNER/REPO` repository argument is omitted, it defaults to the name of the authenticating user.

```
gh repo clone REPOSITORY
```

You can also use the GitHub URL to clone a repository.

```
gh repo clone https://github.com/PATH-TO/REPOSITORY
```

- 1 On your GitHub Enterprise Server instance, navigate to the main page of the repository.
- 2 Above the list of files, click `<>` **Code**.

ed PR going into production 6 hours ago

- 3 To clone and open the repository with GitHub Desktop, click  **Open with GitHub Desktop**.

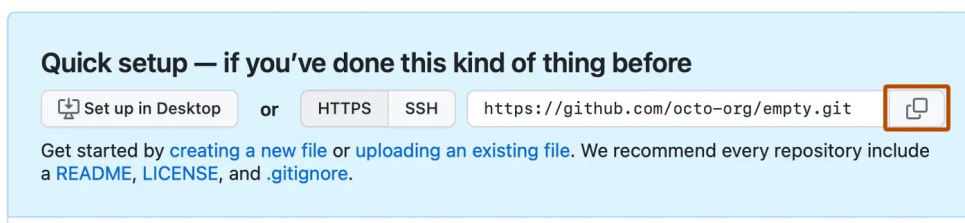

- 4 Follow the prompts in GitHub Desktop to complete the clone.

For more information, see "[Cloning a repository from GitHub to GitHub Desktop](#)."

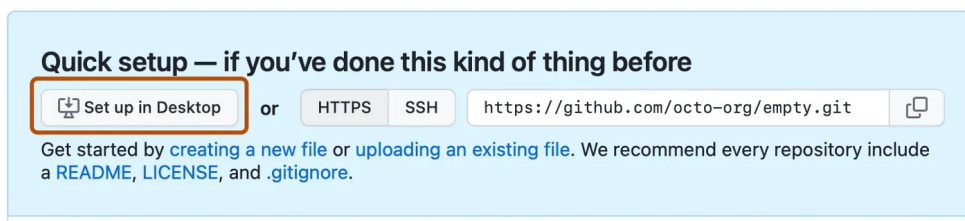

Cloning an empty repository

An empty repository contains no files. It's often made if you don't initialize the repository with a README when creating it.

- 1 On your GitHub Enterprise Server instance, navigate to the main page of the repository.
- 2 To clone your repository using the command line using HTTPS, under "Quick setup", click . To clone the repository using an SSH key, including a certificate issued by your organization's SSH certificate authority, click **SSH**, then click .

Alternatively, to clone your repository in Desktop, click  **Set up in Desktop** and follow the prompts to complete the clone.

- 3 Open TerminalTerminalGit Bash.
- 4 Change the current working directory to the location where you want the cloned directory.
- 5 Type `git clone` , and then paste the URL you copied earlier.

```
git clone https://HOSTNAME/YOUR-USERNAME/YOUR-REPOSITORY
```

- 6 Press **Enter** to create your local clone.

```
$ git clone https://HOSTNAME/YOUR-USERNAME/YOUR-REPOSITORY
> Cloning into `Spoon-Knife`...
> remote: Counting objects: 10, done.
> remote: Compressing objects: 100% (8/8), done.
> remote: Total 10 (delta 1), reused 10 (delta 1)
> Unpacking objects: 100% (10/10), done.
```

Troubleshooting cloning errors [↗](#)

When cloning a repository it's possible that you might encounter some errors.

If you're unable to clone a repository, check that:

- You can connect using HTTPS. For more information, see "[Troubleshooting cloning errors](#)."
- You have permission to access the repository you want to clone. For more information, see "[Troubleshooting cloning errors](#)."
- The default branch you want to clone still exists. For more information, see "[Troubleshooting cloning errors](#)."
