

Guides

Learn about getting started with the REST API, authentication, and how to use the REST API for a variety of tasks.

This section of the documentation is intended to get you up-and-running with real-world GitHub Enterprise Server API applications. We'll go over everything you need to know, from authentication to results manipulation to integrating results with other apps. Every tutorial will include a project, and each project will be saved and documented in our public [platform-samples](#) repository.
