

**This version of GitHub Enterprise was discontinued on 2023-03-15.** No patch releases will be made, even for critical security issues. For better performance, improved security, and new features, [upgrade to the latest version of GitHub Enterprise](#). For help with the upgrade, [contact GitHub Enterprise support](#).

# About code scanning alerts

## In this article

About alerts from code scanning

About alert details

---

Learn about the different types of code scanning alerts and the information that helps you understand the problem each alert highlights.

Code scanning is available for organization-owned repositories in GitHub Enterprise Server. This feature requires a license for GitHub Advanced Security. For more information, see "[About GitHub Advanced Security](#)."

**Note:** Your site administrator must enable code scanning for your GitHub Enterprise Server instance before you can use this feature. For more information, see "[Configuring code scanning for your appliance](#)."

## About alerts from code scanning

You can configure code scanning to check the code in a repository using the default CodeQL analysis, a third-party analysis, or multiple types of analysis. When the analysis is complete, the resulting alerts are displayed alongside each other in the security view of the repository. Results from third-party tools or from custom queries may not include all of the properties that you see for alerts detected by GitHub's default CodeQL analysis. For more information, see "[Configuring code scanning for a repository](#)."

By default, code scanning analyzes your code periodically on the default branch and during pull requests. For information about managing alerts on a pull request, see "[Triaging code scanning alerts in pull requests](#)."

You can audit the actions taken in response to code scanning alerts using GitHub tools. For more information, see "[Auditing security alerts](#)."

## About alert details

Each alert highlights a problem with the code and the name of the tool that identified it. You can see the line of code that triggered the alert, as well as properties of the alert, such as the alert severity, security severity, and the nature of the problem. Alerts also tell you when the issue was first introduced. For alerts identified by CodeQL analysis, you will also see information on how to fix the problem.

## Uncontrolled data used in path expression

Accessing paths influenced by users can allow an attacker to access unexpected resources.

Open

Branch: main

spec-main/security-warnings-spec.ts:34

```
31     const uri = url.parse(request.url!).pathname!;
32     let filename = path.join(__dirname, '..', 'spec', 'fixtures', 'pages', uri);
33
34     fs.stat(filename, (error, stats) => {
35
36         if (error) {
37             response.writeHead(404, { 'Content-Type': 'text/plain' });
38             response.end();
39         }
40     });
```

This path depends on a user-provided value.

CodeQL Show paths

Tool	Rule ID	Query
CodeQL	js/path-injection	View source

Accessing files using paths constructed from user-controlled data can allow an attacker to access unexpected resources. This can result in sensitive information being revealed or deleted, or an attacker being able to influence behavior by modifying unexpected files.

If you configure code scanning using CodeQL, you can also find data-flow problems in your code. Data-flow analysis finds potential security issues in code, such as: using data insecurely, passing dangerous arguments to functions, and leaking sensitive information.

When code scanning reports data-flow alerts, GitHub shows you how data moves through the code. Code scanning allows you to identify the areas of your code that leak sensitive information, and that could be the entry point for attacks by malicious users.

## About severity levels

Alert severity levels may be `Error`, `Warning`, or `Note`.

If code scanning is enabled as a pull request check, the check will fail if it detects any results with a severity of `error`. You can specify which severity level of code scanning alerts causes a check failure. For more information, see "[Customizing code scanning](#)."

## About security severity levels

Code scanning displays security severity levels for alerts that are generated by security queries. Security severity levels can be `Critical`, `High`, `Medium`, or `Low`.

To calculate the security severity of an alert, we use Common Vulnerability Scoring System (CVSS) data. CVSS is an open framework for communicating the characteristics and severity of software vulnerabilities, and is commonly used by other security products to score alerts. For more information about how severity levels are calculated, see [this blog post](#).

By default, any code scanning results with a security severity of `Critical` or `High` will cause a check failure. You can specify which security severity level for code scanning results should cause a check failure. For more information, see "[Customizing code scanning](#)."

## About labels for alerts that are not found in application code

GitHub Enterprise Server assigns a category label to alerts that are not found in application code. The label relates to the location of the alert.

- **Generated:** Code generated by the build process
- **Test:** Test code
- **Library:** Library or third-party code

- **Documentation:** Documentation

Code scanning categorizes files by file path. You cannot manually categorize source files.

In this example, an alert is marked as in "Test" code in the code scanning alert list.

Test

main

#217 closed as fixed 4 months ago • Detected by CodeQL in tests/rendering/rest.js:23 4 months ago

When you click through to see details for the alert, you can see that the file path is marked as "Test" code.

tests/rendering/server.js:127 

Test

124 expect(csp.get('default-src')).toBe('none')

125

126 expect(csp.get('font-src').includes("'self'")).toBe(true)

127 expect(csp.get('font-src').includes(AZURE\_STORAGE\_URL)).toBe(true)

'githubdocs.azureedge.net' can be anywhere in the URL, and arbitrary hosts may come before or after it.
