

# **Deploying Docker to Azure App Service**

In this article

Introduction

Prerequisites

Creating the workflow

Additional resources

You can deploy a Docker container to Azure App Service as part of your continuous deployment (CD) workflows.

#### Introduction @

This guide explains how to use GitHub Actions to build and deploy a Docker container to Azure App Service.

**Note**: If your GitHub Actions workflows need to access resources from a cloud provider that supports OpenID Connect (OIDC), you can configure your workflows to authenticate directly to the cloud provider. This will let you stop storing these credentials as long-lived secrets and provide other security benefits. For more information, see "About security hardening with OpenID Connect" and "Configuring OpenID Connect in Azure."

### Prerequisites @

Before creating your GitHub Actions workflow, you will first need to complete the following setup steps:

Create an Azure App Service plan.

For example, you can use the Azure CLI to create a new App Service plan:

In the command above, replace MY\_RESOURCE\_GROUP with your pre-existing Azure Resource Group, and MY\_APP\_SERVICE\_PLAN with a new name for the App Service plan.

See the Azure documentation for more information on using the Azure CLI:

- For authentication, see "Sign in with Azure CLI."
- If you need to create a new resource group, see "az group."

For example, you can use the Azure CLI to create an Azure App Service web app:

```
az webapp create \
--name MY_WEBAPP_NAME \
--plan MY_APP_SERVICE_PLAN \
--resource-group MY_RESOURCE_GROUP \
--deployment-container-image-name nginx:latest
```

In the command above, replace the parameters with your own values, where MY WEBAPP NAME is a new name for the web app.

3 Configure an Azure publish profile and create an AZURE\_WEBAPP\_PUBLISH\_PROFILE secret.

Generate your Azure deployment credentials using a publish profile. For more information, see "Generate deployment credentials" in the Azure documentation.

In your GitHub repository, create a secret named AZURE\_WEBAPP\_PUBLISH\_PROFILE that contains the contents of the publish profile. For more information on creating secrets, see "Using secrets in GitHub Actions."

4 Set registry credentials for your web app.

Create a personal access token (classic) with the repo and read:packages scopes. For more information, see "Managing your personal access tokens."

Set DOCKER\_REGISTRY\_SERVER\_URL to https://ghcr.io,
DOCKER\_REGISTRY\_SERVER\_USERNAME to the GitHub username or organization that
owns the repository, and DOCKER\_REGISTRY\_SERVER\_PASSWORD to your personal access
token from above. This will give your web app credentials so it can pull the
container image after your workflow pushes a newly built image to the registry. You
can do this with the following Azure CLI command:

```
az webapp config appsettings set \
     --name MY_WEBAPP_NAME \
     --resource-group MY_RESOURCE_GROUP \
     --settings DOCKER_REGISTRY_SERVER_URL=https://ghcr.io
DOCKER_REGISTRY_SERVER_USERNAME=MY_REPOSITORY_OWNER
DOCKER_REGISTRY_SERVER_PASSWORD=MY_PERSONAL_ACCESS_TOKEN
```

Optionally, configure a deployment environment. Environments are used to describe a general deployment target like production, staging, or development. When a GitHub Actions workflow deploys to an environment, the environment is displayed on the main page of the repository. You can use environments to require approval for a job to proceed, restrict which branches can trigger a workflow, gate deployments with custom deployment protection rules, or limit access to secrets. For more information about creating environments, see "Using environments for deployment."

## Creating the workflow &

Once you've completed the prerequisites, you can proceed with creating the workflow.

The following example workflow demonstrates how to build and deploy a Docker container to Azure App Service when there is a push to the main branch.

Ensure that you set AZURE WEBAPP NAME in the workflow env key to the name of the web

app you created.

If you configured a deployment environment, change the value of environment to be the name of your environment. If you did not configure an environment or if your workflow is in a private repository and you do not use GitHub Enterprise Cloud, delete the environment key.

```
Q
YAML
# This workflow uses actions that are not certified by GitHub.
# They are provided by a third-party and are governed by
# separate terms of service, privacy policy, and support
# documentation.
# GitHub recommends pinning actions to a commit SHA.
# To get a newer version, you will need to update the SHA.
# You can also reference a tag or branch, but the action may change without
warning.
name: Build and deploy a container to an Azure Web App
env:
  AZURE WEBAPP NAME: MY WEBAPP NAME # set this to your application's name
on:
  push:
    branches:
      - main
permissions:
  contents: 'read'
  packages: 'write'
jobs:
  build:
    runs-on: ubuntu-latest
    steps:
       - uses: actions/checkout@v4
       - name: Set up Docker Buildx
        uses: docker/setup-buildx-action@v2
       - name: Log in to GitHub container registry
        uses: docker/login-action@v2
        with:
           registry: ghcr.io
           username: ${{ github.actor }}
           password: ${{ secrets.GITHUB TOKEN }}
       - name: Lowercase the repo name
        run: echo "REPO=${GITHUB_REPOSITORY,,}" >>${GITHUB_ENV}
       - name: Build and push container image to registry
        uses: docker/build-push-action@v4
        with:
           push: true
           tags: ghcr.io/${{ env.REPO }}:${{ github.sha }}
           file: ./Dockerfile
  deploy:
    runs-on: ubuntu-latest
    needs: build
    environment:
      name: 'production'
      url: ${{ steps.deploy-to-webapp.outputs.webapp-url }}
```

```
steps:
    name: Lowercase the repo name
    run: echo "REPO=${GITHUB_REPOSITORY,,}" >>${GITHUB_ENV}

- name: Deploy to Azure Web App
    id: deploy-to-webapp
    uses: azure/webapps-deploy@85270a1854658d167ab239bce43949edb336fa7c
    with:
        app-name: ${{ env.AZURE_WEBAPP_NAME }}
        publish-profile: ${{ secrets.AZURE_WEBAPP_PUBLISH_PROFILE }}
        images: 'ghcr.io/${{ env.REPO }}:${{ github.sha }}'
```

### Additional resources &

The following resources may also be useful:

- For the original starter workflow, see <a href="azure-container-webapp.yml">azure-container-webapp.yml</a> in the GitHub Actions starter-workflows repository.
- The action used to deploy the web app is the official Azure <u>Azure/webapps-deploy</u> action.
- For more examples of GitHub Action workflows that deploy to Azure, see the <u>actions-workflow-samples</u> repository.
