Introduction

Prerequisites

Creating the workflow

Additional resources

You can deploy your Python project to Azure App Service as part of your continuous deployment (CD) workflows.

**Note:** GitHub-hosted runners are not currently supported on GitHub Enterprise Server. You can see more information about planned future support on the <u>GitHub public roadmap</u>.

#### Introduction @

This guide explains how to use GitHub Actions to build and deploy a Python project to Azure App Service.

**Note**: If your GitHub Actions workflows need to access resources from a cloud provider that supports OpenID Connect (OIDC), you can configure your workflows to authenticate directly to the cloud provider. This will let you stop storing these credentials as long-lived secrets and provide other security benefits. For more information, see "About security hardening with OpenID Connect" and "Configuring OpenID Connect in Azure."

## Prerequisites @

Before creating your GitHub Actions workflow, you will first need to complete the following setup steps:

1 Create an Azure App Service plan.

For example, you can use the Azure CLI to create a new App Service plan:

In the command above, replace MY\_RESOURCE\_GROUP with your pre-existing Azure Resource Group, and MY\_APP\_SERVICE\_PLAN with a new name for the App Service plan.

See the Azure documentation for more information on using the <u>Azure CLI</u>:

- For authentication, see "Sign in with Azure CLI."
- If you need to create a new resource group, see "az group."
- 2 Create a web app.

For example, you can use the Azure CLI to create an Azure App Service web app with a Python runtime:

In the command above, replace the parameters with your own values, where MY WEBAPP NAME is a new name for the web app.

3 Configure an Azure publish profile and create an AZURE\_WEBAPP\_PUBLISH\_PROFILE secret.

Generate your Azure deployment credentials using a publish profile. For more information, see "Generate deployment credentials" in the Azure documentation.

In your GitHub repository, create a secret named AZURE\_WEBAPP\_PUBLISH\_PROFILE that contains the contents of the publish profile. For more information on creating secrets, see "Using secrets in GitHub Actions."

- 4 Add an app setting called SCM DO BUILD DURING DEPLOYMENT and set the value to 1.
- Optionally, configure a deployment environment. Environments are used to describe a general deployment target like production, staging, or development. When a GitHub Actions workflow deploys to an environment, the environment is displayed on the main page of the repository. You can use environments to require approval for a job to proceed, restrict which branches can trigger a workflow, gate deployments with custom deployment protection rules, or limit access to secrets. For more information about creating environments, see "Using environments for deployment."

# Creating the workflow &

Once you've completed the prerequisites, you can proceed with creating the workflow.

The following example workflow demonstrates how to build and deploy a Python project to Azure App Service when there is a push to the main branch.

Ensure that you set <code>AZURE\_WEBAPP\_NAME</code> in the workflow <code>env</code> key to the name of the web app you created. If you use a version of Python other than <code>3.8</code>, <code>change PYTHON\_VERSION</code> to the version that you use.

If you configured a deployment environment, change the value of environment to be the name of your environment. If you did not configure an environment, delete the environment key.

# This workflow uses actions that are not certified by GitHub.
# They are provided by a third-party and are governed by

```
# separate terms of service, privacy policy, and support
# documentation.
# GitHub recommends pinning actions to a commit SHA.
# To get a newer version, you will need to update the SHA.
# You can also reference a tag or branch, but the action may change without
warning.
name: Build and deploy Python app to Azure Web App
env:
 AZURE WEBAPP NAME: MY WEBAPP NAME # set this to your application's name
  PYTHON VERSION: '3.8'
                                      # set this to the Python version to use
on:
 push:
    branches:
      - main
jobs:
 build:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v4
      - name: Set up Python version
        uses: actions/setup-python@v4
        with:
          python-version: ${{ env.PYTHON_VERSION }}
      - name: Create and start virtual environment
        run:
          python -m venv venv
          source venv/bin/activate
      - name: Set up dependency caching for faster installs
        uses: actions/cache@v3
        with:
          path: ~/.cache/pip
          key: ${{ runner.os }}-pip-${{ hashFiles('**/requirements.txt') }}
          restore-keys: |
            ${{ runner.os }}-pip-
      - name: Install dependencies
        run: pip install -r requirements.txt
      # Optional: Add a step to run tests here (PyTest, Django test suites, etc.)
      - name: Upload artifact for deployment jobs
        uses: actions/upload-artifact@v3
        with:
          name: python-app
          path: |
            !venv/
  deploy:
    runs-on: ubuntu-latest
    needs: build
    environment:
      name: 'production'
      url: ${{ steps.deploy-to-webapp.outputs.webapp-url }}
    steps:
      - name: Download artifact from build job
        uses: actions/download-artifact@v3
        with:
          name: python-app
          path: .
      - name: 'Deploy to Azure Web App'
```

```
id: deploy-to-webapp
uses: azure/webapps-deploy@85270a1854658d167ab239bce43949edb336fa7c
with:
    app-name: ${{ env.AZURE_WEBAPP_NAME }}
    publish-profile: ${{ secrets.AZURE_WEBAPP_PUBLISH_PROFILE }}
```

### Additional resources @

The following resources may also be useful:

- For the original starter workflow, see <a href="azure-webapps-python.yml">azure-webapps-python.yml</a> in the GitHub Actions starter-workflows repository.
- The action used to deploy the web app is the official Azure <u>Azure/webapps-deploy</u> action
- For more examples of GitHub Action workflows that deploy to Azure, see the <u>actions-workflow-samples</u> repository.
