

2

The REST API is now versioned. For more information, see "About API versioning."

Deployment statuses

Use the REST API to manage deployment statuses.

List deployment statuses *₽*

Works with <u>GitHub Apps</u>

Users with pull access can view deployment statuses for a deployment:

Parameters for "List deployment statuses"

Headers

accept string

Setting to application/vnd.github+json is recommended.

Path parameters

owner string Required

The account owner of the repository. The name is not case sensitive.

repo string Required

The name of the repository without the .git extension. The name is not case sensitive.

deployment_id integer Required

deployment_id parameter

Query parameters

per_page integer

The number of results per page (max 100).

Default: 30

page integer

Page number of the results to fetch.

Default: 1

Status code	Description
200	ОК
404	Resource not found

```

Create a deployment status ∂

Works with <u>GitHub Apps</u>

Users with push access can create deployment statuses for a given deployment.

GitHub Apps require read & write access to "Deployments" and read-only access to "Repo contents" (for private repos). OAuth apps require the repo deployment scope.

Parameters for "Create a deployment status"

Headers

accept string

Setting to application/vnd.github+json is recommended.

Path parameters

owner string Required

The account owner of the repository. The name is not case sensitive.

repo string Required

The name of the repository without the .git extension. The name is not case sensitive.

deployment_id integer Required

deployment_id parameter

Body parameters

state string Required

The state of the status. When you set a transient deployment to inactive, the deployment will be shown as destroyed in GitHub.

Can be one of: error , failure , inactive , in_progress , queued , pending , success

target_url string

The target URL to associate with this status. This URL should contain output to keep the user updated while the task is running or serve as historical information for what happened in the deployment. **Note:** It's recommended to use the <code>log_url</code> parameter, which replaces <code>target_url</code>.

Default: ""

log_url string

The full URL of the deployment's output. This parameter replaces <code>target_url</code> . We will continue to accept <code>target_url</code> to support legacy uses, but we recommend replacing <code>target_url</code> with <code>log_url</code> . Setting <code>log_url</code> will automatically set <code>target_url</code> to the same value. Default: ""

Default: ""

description string

A short description of the status. The maximum description length is 140 characters.

Default: ""

environment string

Name for the target deployment environment, which can be changed when setting a deploy status. For example, production, staging, or qa. If not defined, the environment of the previous status on the deployment will be used, if it exists. Otherwise, the environment of the deployment will be used.

environment url string

Sets the URL for accessing your environment. Default: ""

Default: ""

auto_inactive boolean

Adds a new inactive status to all prior non-transient, non-production environment deployments with the same repository and environment name as the created status's deployment. An inactive status is only added to deployments that had a success state. Default: true

HTTP response status codes for "Create a deployment status"

Status code	Description
201	Created
422	Validation failed, or the endpoint has been spammed.
