GitHub Actions / Migrate to GitHub Actions / Automated migrations / Automate migration with GitHub Actions Importer

This version of GitHub Enterprise was discontinued on 2023-03-15. No patch releases will be made, even for critical security issues. For better performance, improved security, and new features, <u>upgrade to the latest version of GitHub Enterprise</u>. For help with the upgrade, <u>contact GitHub Enterprise support</u>.

Automating migration with GitHub Actions Importer

In this article

About GitHub Actions Importer

Supported CI platforms

Prerequisites

Using the GitHub Actions Importer CLI

Performing self-serve migrations using IssueOps

Using the GitHub Actions Importer labs repository

Legal notice

Use GitHub Actions Importer to plan and automate your migration to GitHub Actions.

Note: GitHub-hosted runners are not currently supported on GitHub Enterprise Server. You can see more information about planned future support on the <u>GitHub public roadmap</u>.

About GitHub Actions Importer @

You can use GitHub Actions Importer to plan and automatically migrate your CI/CD pipelines to GitHub Actions from Azure DevOps, CircleCI, GitLab, Jenkins, and Travis CI.

GitHub Actions Importer is distributed as a Docker container, and uses a <u>GitHub CLI</u> extension to interact with the container.

Any workflow that is converted by the GitHub Actions Importer should be inspected for correctness before using it as a production workload. The goal is to achieve an 80% conversion rate for every workflow, however, the actual conversion rate will depend on the makeup of each individual pipeline that is converted.

Supported CI platforms @

You can use GitHub Actions Importer to migrate from the following platforms:

- Azure DevOps
- Bamboo
- CircleCI
- GitLab

- Jenkins
- Travis CI

Prerequisites @

GitHub Actions Importer has the following requirements:

- An environment where you can run Linux-based containers, and can install the necessary tools.
 - Docker is installed and running.
 - GitHub CLI is installed.

Note: The GitHub Actions Importer container and CLI do not need to be installed on the same server as your CI platform.

Installing the GitHub Actions Importer CLI extension @

1 Install the GitHub Actions Importer CLI extension:

2 Verify that the extension is installed:

Updating the GitHub Actions Importer CLI &

To ensure you're running the latest version of GitHub Actions Importer, you should regularly run the update command:

```
$ gh actions-importer update
```

Authenticating at the command line ${\mathscr O}$

You must configure credentials that allow GitHub Actions Importer to communicate with GitHub and your current CI server. You can configure these credentials using environment variables or a .env.local file. The environment variables can be configured in an interactive prompt, by running the following command:

Using the GitHub Actions Importer CLI @

Use the subcommands of gh actions-importer to begin your migration to GitHub Actions, including audit , forecast , dry-run , and migrate .

Auditing your existing CI pipelines &

The audit subcommand can be used to plan your CI/CD migration by analyzing your current CI/CD footprint. This analysis can be used to plan a timeline for migrating to GitHub Actions.

To run an audit, use the following command to determine your available options:

Forecasting usage @

The forecast subcommand reviews historical pipeline usage to create a forecast of GitHub Actions usage.

To run a forecast, use the following command to determine your available options:

```
$ gh actions-importer forecast -h
Description:
  Forecasts GitHub Actions usage from historical pipeline utilization.
[...]
Commands:
  azure-devops Forecasts GitHub Actions usage from historical Azure DevOps pipeline
  bamboo
               Forecasts GitHub Actions usage from historical Bamboo pipeline util:
  jenkins
               Forecasts GitHub Actions usage from historical Jenkins pipeline uti
               Forecasts GitHub Actions usage from historical GitLab pipeline util:
  gitlab
  circle-ci
               Forecasts GitHub Actions usage from historical CircleCI pipeline ut:
  travis-ci
               Forecasts GitHub Actions usage from historical Travis CI pipeline ut
  github
               Forecasts GitHub Actions usage from historical GitHub pipeline util:
```

Testing the migration process &

The dry-run subcommand can be used to convert a pipeline to its GitHub Actions equivalent, and then write the workflow to your local filesystem.

To perform a dry run, use the following command to determine your available options:

```
$ gh actions-importer dry-run -h
Description:
 Convert a pipeline to a GitHub Actions workflow and output its yaml file.
[...]
Commands:
 azure-devops Convert an Azure DevOps pipeline to a GitHub Actions workflow and o
 bamboo
               Convert a Bamboo pipeline to GitHub Actions workflows and output its
             Convert a CircleCI pipeline to GitHub Actions workflows and output
 circle-ci
               Convert a GitLab pipeline to a GitHub Actions workflow and output the
 gitlab
 jenkins
              Convert a Jenkins job to a GitHub Actions workflow and output its yo
  travis-ci
              Convert a Travis CI pipeline to a GitHub Actions workflow and output
```

Migrating a pipeline to GitHub Actions &

The migrate subcommand can be used to convert a pipeline to its GitHub Actions equivalent and then create a pull request with the contents.

To run a migration, use the following command to determine your available options:

Performing self-serve migrations using IssueOps ∂

You can use GitHub Actions and GitHub Issues to run CLI commands for GitHub Actions Importer. This allows you to migrate your CI/CD workflows without installing software on your local machine. This approach is especially useful for organizations that want to enable self-service migrations to GitHub Actions. Once IssueOps is configured, users can open an issue with the relevant template to migrate pipelines to GitHub Actions.

For more information about setting up self-serve migrations with IssueOps, see the actions/importer-issue-ops template repository.

Using the GitHub Actions Importer labs repository @

The GitHub Actions Importer labs repository contains platform-specific learning paths that teach you how to use GitHub Actions Importer and how to approach migrations to GitHub Actions. You can use this repository to learn how to use GitHub Actions Importer to help plan, forecast, and automate your migration to GitHub Actions.

To learn more, see the <u>GitHub Actions Importer labs repository</u>.
