Managing your code scanning configuration

You can manage your existing code scanning configuration with the help of metrics and logging outputs generated by your analysis.

> Code scanning is available for all public repositories on GitHub.com. To use code scanning in a private repository owned by an organization, you must have a license for GitHub Advanced Security. For more information, see "About GitHub Advanced Security."

About the tool status page for code scanning

The tool status page shows useful information about all of your code scanning tools. If code scanning is not working as you'd expect, the tool status page is a good starting point for debugging problems.

Editing your configuration of default setup

You can edit your existing configuration of default setup for code scanning to better meet your code security needs.

Built-in CodeQL query suites

You can choose from different built-in CodeQL query suites to use in your CodeQL code scanning setup.

Viewing code scanning logs

You can view the output generated during code scanning analysis in GitHub.com.
