Enabling default setup takes too long

If you think that enabling default setup has stalled, you can restart the process.

When you enable default setup, a workflow is triggered with the automatically generated configuration. This run is used to test whether default setup works for all CodeQL-supported languages in the repository.

You can check on the progress of the test run for default setup on the **Actions** tab. If the run is taking too long, try canceling the workflow run and restarting the configuration process.

To restart your configuration, navigate to the main page of your repository, then click ⊙ **Actions**. Click the **CodeQL** workflow run that's in progress, then click **Cancel workflow**. Once ⓘ appears beside the workflow run name, navigate back to the **Code security and analysis** settings and re-enable default setup. If default setup continues to stall, please contact your site administrator or try enabling advanced setup. For more information, see "[Configuring advanced setup for code scanning](#)."
